AMENDMENTS TO THE CLAIMS

This listing of claims will replace all prior versions and listings of claims in the application:

LISTING OF CLAIMS:

1. (previously presented): A radiation image recording and read-out method, comprising the steps of:

i) supporting a stimulable phosphor sheet at a position for image recording, at which one surface of the stimulable phosphor sheet is exposed to radiation,

ii) exposing the one surface of the stimulable phosphor sheet, which is supported at the position for image recording, to the radiation, a radiation image being thereby stored on the stimulable phosphor sheet,

iii) performing an image read-out operation from a side of the other surface of the stimulable phosphor sheet supported at the position for image recording, which other surface is opposite to the one surface of the stimulable phosphor sheet exposed to the radiation, the image read-out operation being performed by irradiating stimulating rays in two-dimensional directions to the stimulable phosphor sheet as the sheet is held in a substantially stationary position, on which the radiation image has been stored during its exposure to the radiation, the stimulating rays causing the stimulable phosphor sheet to emit light in proportion to an amount of energy stored thereon during its exposure to the radiation, and photoelectrically detecting the emitted

light, an image signal, which represents the radiation image having been stored on the stimulable phosphor sheet, being thereby obtained, and

iv) releasing energy, which remains on the stimulable phosphor sheet after the image signal has been obtained from the stimulable phosphor sheet, by irradiating erasing light to an entire area of the stimulable phosphor sheet with a sheet-shaped erasing light source, the sheet-shaped erasing light source being located in close vicinity to the stimulable phosphor sheet and on a side of the one surface of the stimulable phosphor sheet supported at the position for image recording, which one surface is exposed to the radiation, the sheet-shaped erasing light source having uniform transmissivity to the radiation,

wherein the stimulable phosphor sheet comprises a sheet-shaped transparent substrate and a stimulable phosphor layer,

the sheet-shaped erasing light source is arranged on one side of the sheet-shaped transparent substrate, and the stimulable phosphor layer is arrange on another side, which is opposite to the one side, of the sheet-shaped transparent substrate, and

the stimulating rays for the image read-out irradiate the stimulable phosphor layer at the side opposite to the side exposed to the radiation.

2. (original): A method as defined in Claim 1 wherein the sheet-shaped erasing light source comprises an organic electroluminescence device.

3. (original): A method as defined in Claim 1 wherein the sheet-shaped erasing light source comprises a transparent sheet, which has light diffusing properties, the transparent sheet

being capable of radiating out the erasing light from a surface, which stands facing the stimulable phosphor sheet, toward the stimulable phosphor sheet, and

light sources, each of which is located at one of two ends of the transparent sheet and produces the erasing light such that the erasing light enters from the one end of the transparent sheet into the transparent sheet.

4. (original): A method as defined in claim 3 wherein at least either one of two surfaces of the transparent sheet is formed as a light diffusing surface.

5. (original): A method as defined in Claim 3 wherein the transparent sheet contains light diffusing particles dispersed therein.

6. (canceled).

7. (original): A method as defined in Claim 1, 2, 3, 4, or 5 wherein the stimulable phosphor sheet is kept stationary at the position for image recording, and

the image read-out operation is performed with a read-out unit for irradiating the stimulating rays to the stimulable phosphor sheet in a one-dimensional direction along a main scanning direction and detecting the light, which is emitted by the stimulable phosphor sheet when the stimulating rays are irradiated to the stimulable phosphor sheet in the one-dimensional direction, the read-out unit being moved in a sub-scanning direction.

8. (original): A method as defined in Claim 7 wherein the read-out unit comprises a linear stimulating ray source, which linearly irradiates the stimulating rays to an area of the stimulable phosphor sheet, and

a line sensor, which is located along the linear area of the stimulable phosphor sheet exposed to the linear stimulating rays and photoelectrically detects the light emitted by the stimulable phosphor sheet when the stimulating rays are irradiated to the stimulable phosphor sheet.

9. (previously presented): A radiation image recording and read-out apparatus, comprising:

i) an image recording section for supporting a stimulable phosphor sheet at a position for image recording, at which one surface of the stimulable phosphor sheet is exposed to radiation,

ii) image read-out means located on a side of the other surface of the stimulable phosphor sheet supported at the position for image recording, which other surface is opposite to the one surface of the stimulable phosphor sheet exposed to the radiation, the image read-out means performing an image read-out operation by irradiating stimulating rays in two-dimensional directions to the stimulable phosphor sheet as the sheet is being held in a substantially stationary position, on which a radiation image has been stored during its exposure to the radiation, the stimulating rays causing the stimulable phosphor sheet to emit light in proportion to an amount of energy stored thereon during its exposure to the radiation, and photoelectrically detecting the emitted light, an image signal, which represents the radiation image having been stored on the stimulable phosphor sheet, being thereby obtained, and

iii) a sheet-shaped erasing light source located in close vicinity to the stimulable phosphor sheet and on a side of the one surface of the stimulable phosphor sheet supported at the position for image recording, which one surface is exposed to the radiation, the sheet-shaped

erasing light source having uniform transmissivity to the radiation, the sheet-shaped erasing light source releasing energy, which remains on the stimulable phosphor sheet after the image signal has been obtained from the stimulable phosphor sheet, by irradiating erasing light to an entire area of the stimulable phosphor sheet,

wherein the stimulable phosphor sheet comprises a sheet-shaped transparent substrate and a stimulable phosphor layer,

the sheet-shaped erasing light source is arranged on one side of the sheet-shaped transparent substrate, and the stimulable phosphor layer is arrange on another side, which is opposite to the one side, of the sheet-shaped transparent substrate, and

the stimulating rays for the image read-out irradiate the stimulable phosphor layer at the side opposite to the side exposed to the radiation.

10. (original): An apparatus as defined in Claim 9 wherein the sheet-shaped erasing light source comprises an organic electroluminescence device.

11. (original): An apparatus as defined in Claim 9 wherein the sheet-shaped erasing light source comprises a transparent sheet, which has light diffusing properties, the transparent sheet being capable of radiating out the erasing light from a surface, which stands facing the stimulable phosphor sheet, toward the stimulable phosphor sheet, and

light sources, each of which is located at one of two ends of the transparent sheet and produces the erasing light such that the erasing light enters from the one end of the transparent sheet into the transparent sheet.

12. (original): An apparatus as defined in Claim 11 wherein at least either one of two surfaces of the transparent sheet is formed as a light diffusing surface.

13. (original): An apparatus as defined in Claim 11 wherein the transparent sheet contains light diffusing particles dispersed therein.

14. (canceled).

15. (original): An apparatus as defined in claim 9, 10, 11, 12, or 13 wherein the stimulable phosphor sheet is kept stationary at the position for image recording, and

the image read-out means comprises:

a) a read-out unit for irradiating the stimulating rays to the stimulable phosphor sheet in a one-dimensional direction along a main scanning direction and detecting the light, which is emitted by the stimulable phosphor sheet when the stimulating rays are irradiated to the stimulable phosphor sheet in the one-dimensional direction, and

b) unit moving means for moving the read-out unit in a sub-scanning direction.

16. (original): An apparatus as defined in Claim 15 wherein the read-out unit comprises a linear stimulating ray source, which linearly irradiates the stimulating rays to an area of the stimulable phosphor sheet, and

a line sensor, which is located along the linear area of the stimulable phosphor sheet exposed to the linear stimulating rays and photoelectrically detects the light emitted by the stimulable phosphor sheet when the stimulating rays are irradiated to the stimulable phosphor sheet.

17. (previously presented): The method as defined in claim 1, wherein the stimulable phosphor sheet is maintained at said position during said performing of the read–out operation and said irradiating of the erasing light source.

18. (previously presented): The apparatus as defined in claim 9, wherein the stimulable phosphor sheet is maintained at said position during operation of the read-out means and the erasing light source.

19. (previously presented): The method as defined in claim 1, wherein the erasing light is sufficient to erase substantially all of the energy which remains on the stimulable phosphor sheet after said performing of the read-out operation.

20. (previously presented): The apparatus as defined in claim 9, wherein the wherein the erasing light is sufficient to erase substantially all of said energy which remains on the stimulable phosphor sheet after the image signal has been obtained from the stimulable phosphor sheet.
